

Protocol Overview

GoChain started with an idea to fix the blockchain scaling problem while bringing an enterprise team and business philosophy to the space. It quickly turned into a global community of developers and amazing supporters. We hit our goal of fixing the scaling problem by providing a public blockchain network that handles 100x the volume of Ethereum, while remaining 100% Ethereum compatible. GoChain is the most reliable and highest performance Ethereum/web3 compatible blockchain on the market today. We stand behind this claim and please do try to prove us wrong.

"We've hit every milestone we set out to achieve in year one, and now we're going to provide the service and support our users are demanding. GoChain has performed extremely well in a public, decentralized network and since it is a permissioned blockchain, it is also perfect for private networks." - Travis Reeder, CTO & Co-Founder

BUILD DECENTRALIZED APPS

100% Ethereum compatible means you can use all the same tools, wallets and smart contracts.

RUN PRIVATE BLOCKCHAINS

The GoChain client and protocol is the most reliable and highest performance blockchain for private networks. Easy setup and easy maintenance.

ENTERPRISE SERVICES

Need help architecting or implementing your DApps or private blockchain infrastructure? Let our engineers help you get there faster.

Public Network Achievements

10x More Decentralized

Open decentralization did not work as intended as more than 70% of mining is in China and the majority of that is run by just a few companies. GoChain forces nodes to be in different countries, run by unrelated people/companies.

100x Speed & Performance

GoChain supports high transaction volume with fast verifications. Ethereum can only process 13 transactions per second, GoChain can process 1300 transactions per second.

1000x Greener

The energy used to run the Bitcoin network alone could power more than 3.5 million US households, 1 million to run Ethereum. We think that's completely unacceptable and unsustainable. GoChain uses a small fraction of the energy used to run other cryptocurrencies.

We provide a full suite of products to run and manage a blockchain network. All of our tools have been thoroughly tested and vetted in a public environment for over a year, so you know you're getting a rock solid product.

Enterprise tough.
